gas equipment

SAFETY CHECKS

- Onsite inspection by a fully qualified inspector
- Thorough functional and leak test of regulators, flashback arrestors, hoses, torches and associated fittings
- Full report of findings
- Certificate of compliance
- Update on current Health and Safety and BCGA Codes of Practice
- Competitive rates on replacement parts

€55.00 plus VAT
per set

Do you understand the safety implications of not checking your gas equipment?

Under Safety, Health and Welfare at Work Act 2005: an employer or self employed person has a responsibility to provide and maintain plant and systems of work that are, so far as reasonably practical, safe and without risk to health.

Under Safety, Health and Welfare at Work General Applications (Amendment) 2007: require the user of an installed system and the user of a mobile system, properly maintained in good repair so as to prevent danger.

The British Compressed Gas Associations Code of Practice CP7 recommends the regulators and flashback arrestors are checked annually and replaced every 5 years. Checks need to be undertaken by a person who has sufficient practical experience of oxy-fuel gas equipment and theoretical knowledge of the functioning of the equipment, the properties of gases used, the potential defects and hazards which may occur and their importance to the integrity and safety of the equipment.

The safety notes applicable to CP7 and GN7 give the minimum safety standards for the use, inspection and maintenance of equipment.

*Annual is the recommended minimum period of time between inspections.
